Teacher's Guide to Using the
Chapter 4 Resource Masters

The *Fast File* Chapter Resource system allows you to conveniently file the resources you use most often. The *Chapter 4 Resource Masters* includes the core materials needed for Chapter 4. These materials include worksheets, extensions, and assessment options. The answers for these pages appear at the back of this booklet.

All of the materials found in this booklet are included for viewing and printing in the *Pre-Algebra TeacherWorks* CD-ROM.

Vocabulary Builder
Pages vii-viii include a student study tool that presents up to twenty of the key vocabulary terms from the chapter. Students are to record definitions and/or examples for each term. You may suggest that students highlight or star the terms with which they are not familiar.

When to Use Give these pages to students before beginning Lesson 4-1. Encourage them to add these pages to their Pre-Algebra Study Notebook. Remind them to add definitions and examples as they complete each lesson.

Study Guide and Intervention
Each lesson in Pre-Algebra addresses one or two objectives. There is one Study Guide and Intervention master for each lesson.

When to Use Use these masters as reteaching activities for students who need additional reinforcement. These pages can also be used in conjunction with the Student Edition as an instructional tool for students who have been absent.

Skills Practice
There is one master for each lesson. These provide computational practice at a basic level.

When to Use These masters can be used with students who have weaker mathematics backgrounds or need additional reinforcement.

Practice
There is one master for each lesson. These problems more closely follow the structure of the Practice and Apply section of the Student Edition exercises. These exercises are of average difficulty.

When to Use These provide additional practice options or may be used as homework for second day teaching of the lesson.

Reading to Learn Mathematics
One master is included for each lesson. The first section of each master asks questions about the opening paragraph of the lesson in the Student Edition. Additional questions ask students to interpret the context of and relationships among terms in the lesson. Finally, students are asked to summarize what they have learned using various representation techniques.

When to Use This master can be used as a study tool when presenting the lesson or as an informal reading assessment after presenting the lesson. It is also a helpful tool for ELL (English Language Learner) students.

Enrichment
There is one extension master for each lesson. These activities may extend the concepts in the lesson, offer an historical or multicultural look at the concepts, or widen students' perspectives on the mathematics they are learning. These are not written exclusively for honors students, but are accessible for use with all levels of students.

When to Use These may be used as extra credit, short-term projects, or as activities for days when class periods are shortened.

Assessment Options

The assessment masters in the *Chapter 4 Resource Masters* offer a wide range of assessment tools for intermediate and final assessment. The following lists describe each assessment master and its intended use.

Chapter Assessment

Chapter Tests
- *Form 1* contains multiple-choice questions and is intended for use with basic level students.
- *Forms 2A and 2B* contain multiple-choice questions aimed at the average level student. These tests are similar in format to offer comparable testing situations.

Factors and Monomials

Finding Factors Two or more numbers that are multiplied to form a product are called factors. Any number is divisible by its factors. The following rules can be used to determine mentally whether a number is divisible by 2, 3, 5, 6, or 10.

A number is divisible by:

- 2 if the ones digit is divisible by 2.
- 3 if the sum of the digits is divisible by 3.
- 5 if the ones digit is 0 or 5.
- 6 if the number is divisible by 2 and by 3.
- 10 if the ones digit is 0.

Example Determine whether 108 is divisible by 2, 3, 5, 6, or 10.

Number	Divisible?	Reason
2	yes	The ones digit is 8, and 8 is divisible by 2.
3	yes	The sum of the digits is 9, and 9 is divisible by 3.
5	no	The ones digit is 8, not 0 or 5.
6	yes	108 is divisible by 2 and by 3.
10	no	The ones digit is not 0.

108 is divisible by 2, 3, and 6.

A **monomial** is a number, a variable, or a product of numbers and/or variables. So, 108 is a monomial. The expression $5q$ is also a monomial since it is the product of a number and a variable, $5 \cdot q$. However, $2x + 1$ is not a monomial since it is the sum of two terms.

Divisibility

| Divisibility rule for 7 |

Determine whether 4032 is divisible by 7.

403X̶	Cross out the ones digit.
− 4	Subtract twice the value of the ones digit from the rest of the number.
39X̶	If the difference is a number that you know is divisible by 7, stop. If not, repeat.
− 18	
21	Since 21 is divisible by 7, 4032 is divisible by 7.

| Divisibility rule for 11 |

Determine whether 5159 is divisible by 11.

Method 1

515X̶	Cross out the ones digit.
− 9	Subtract the value of the ones digit from the rest of the number.
50X̶	If the difference is a number that you know is divisible by 11, stop. If not, repeat.
− 6	
44	Since 44 is divisible by 11, 5159 is divisible by 11.

Method 2

5159

$5 + 5 = 10$	Add the odd-numbered digits (first and third).
$1 + 9 = \underline{10}$	Add the even-numbered digits (second and fourth).
0	Subtract the sums. If the difference is divisible by 11, the number is divisible by 11.

Since 0 is divisible by 11, 5159 is divisible by 11.

Determine whether 62,382 is divisible by 11.

$6 + 3 + 2 = 11$	Add the odd-numbered digits.
$2 + 8 = \underline{10}$	Add the even-numbered digits.
1	Subtract the sums.

Since 1 is not divisible by 11, 62,382 is not divisible by 11.

4-2 Study Guide and Intervention

Powers and Exponents

A number that is expressed using an exponent is called a **power**. The **base** is the number that is multiplied. The **exponent** tells how many times the base is used as a factor. So, 4^3 has a base of 4 and an exponent of 3, and $4^3 = 4 \cdot 4 \cdot 4 = 64$.

Example 1 **Write each expression using exponents.**

a. $10 \cdot 10 \cdot 10 \cdot 10 \cdot 10$

The base is 10. It is a factor 5 times, so the exponent is 5.

$10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 = 10^5$

b. $(p + 2)(p + 2)(p + 2)$

The base is $p + 2$. It is a factor 3 times, so the exponent is 3.

$(p + 2)(p + 2)(p + 2) = (p + 2)^3$

Expressions involving powers are evaluated using order of operations. Powers are repeated multiplications. They are evaluated after any grouping symbols and before other multiplication or division operations.

Example 2 **Evaluate $x^2 - 4$ if $x = -6$.**

$x^2 - 4 = (-6)^2 - 4$	Replace x with -6.
$\quad\quad = (-6)(-6) - 4$	-6 is a factor 2 times.
$\quad\quad = 36 - 4$	Multiply.
$\quad\quad = 32$	Subtract.

1. $5 \cdot 5 \cdot 5 \cdot 5 \cdot 5 \cdot 5 \cdot 5$ **2.** $(-7)(-7)(-7)$

Numbers can be expressed in several ways. Some numbers are expressed as sums. Some numbers are expressed as products of factors, while other numbers are expressed as powers.

Two ways to express 27 are $3 \cdot 3 \cdot 3$ and 3^3.

The number 1 million can be expressed in the following ways.

1,000,000	1000 · 1000	100 · 100 · 100	$10^2 \cdot 10^2 \cdot 10^2$

15. $27 \cdot 9$

16. $81 \cdot 27$

17. $49 \cdot 49$

18. $121 \cdot 121$

4-3 Study Guide and Intervention
Prime Factorization

A **prime number** is a whole number that has exactly two factors, 1 and itself. A **composite number** is a whole number that has more than two factors. Zero and 1 are neither prime nor composite.

Example 1 **Determine whether 29 is prime or composite.**

Find the factors of 29.

$29 = 1 \cdot 29$

The only factors of 29 are 1 and 29, therefore 29 is a prime number.

Any composite number can be written as a product of prime numbers. A factor tree can be used to find the prime factorization.

Example 2 **Find the prime factorization of 48.**
```
        48              48 is the number to be factored.
       /  \
      6    8            Find any pair of whole number factors of 48.
     / \  / \
    2  32 2  4          Continue to factor any number that is not prime.
   /  /  / /  \
  2  3 2 2    2         The factor tree is complete when there is a row of prime numbers.
```

The prime factorization of 48 is $2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$ or $2^4 \cdot 3$.

In algebra, monomials can be factored as a product of prime numbers and variables with no exponent greater than 1. So, $8x^2$ factors as $2 \cdot 2 \cdot 2 \cdot x \cdot x$.

Prime Pyramid

A **prime number** is a whole number that has exactly two factors—itself and 1. The pyramid below is called a *prime pyramid*. Each row begins with 1 and ends with the number of that row. So, row 2 begins with 1 and ends with 2, row 3 begins with 1 and ends with 3, and so on. In each row, the numbers from 1 to the row number are arranged such that the sum of any two adjacent numbers is a prime number.

For example, look at row 4:

- It must contain the numbers 1, 2, 3, and 4.
- It must begin with 1 and end with 4.
- The sum of adjacent pairs must be a prime number:
  $1 + 2 = 3$, $2 + 3 = 5$, $3 + 4 = 7$

4-4 Study Guide and Intervention
Greatest Common Factor (GCF)

The greatest number that is a factor of two or more numbers is the **greatest common factor (GCF)**. Two ways to find the GCF are shown below.

Example 1 **Find the GCF of 24 and 32.**

Method 1 List the factors.

factors of 24: 1, 2, 3, 4, 6, 8, 12, 24   Look for factors common to both lists, 1, 2, 4, and 8.

factors of 32: 1, 2, 4, 8, 16, 32

The greatest common factor of 24 and 32 is 8.

Method 2 Use prime factorization.

$24 = 2 \cdot 2 \cdot 2 \cdot 3$ Find the common prime factors of 24 and 32.
$32 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$

Multiply the common prime factors. The greatest common factor of 24 and 32 is $2 \cdot 2 \cdot 2$ or 8.

In algebra, greatest common factors are used to factor expressions.

Example 2 **Factor $5x + 10$.**

First, find the GCF of $5x$ and 10.

$5x = 5 \cdot x$
$10 = 2 \cdot 5$ The GCF is 5.

Now write each term as a product of the GCF and its remaining factors.

$5x + 10 = 5(x) + 5(2)$
$\qquad\quad = 5(x + 2)$ Distributive Property

So, $5x + 10 = 5(x + 2)$.

GCFs by Successive Division

Another way to find the greatest common factor (GCF) of two numbers is to use **successive division**. This method works well for large numbers.

Find the GCF of 848 and 1325.

Step 1   Divide the smaller number into the greater number.

$$
\begin{array}{r}
1\ \text{R}477 \\
848\,\overline{)1325} \\
\underline{848} \\
477
\end{array}
$$

Step 2   Divide the remainder into the divisor. Repeat this step until you get a remainder of 0.

$$
\begin{array}{rrrr}
1\ \text{R}371 & 1\ \text{R}106 & 3\ \text{R}53 & 2\ \text{R}0 \\
477\,\overline{)848} & 371\,\overline{)477} & 106\,\overline{)371} & 53\,\overline{)106} \\
\underline{477} & \underline{371} & \underline{318} & \underline{106} \\
371 & 106 & 53 & 0
\end{array}
$$

The last divisor is the GCF of the two original numbers. So the GCF of 848 and 1325 is 53.

Simplifying Algebraic Fractions

A fraction is in **simplest form** when the GCF of the numerator and the denominator is 1. One way to write a fraction in simplest form is to write the prime factorization of the numerator and the denominator. Then divide the numerator and denominator by the GCF.

Example 1 Write $\dfrac{18}{24}$ in simplest form.

Write the prime factorization of the numerator and the denominator.

$$\frac{18}{24} = \frac{\overset{1}{\cancel{2}} \cdot \overset{1}{\cancel{3}} \cdot 3}{\underset{1}{\cancel{2}} \cdot 2 \cdot 2 \cdot \underset{1}{\cancel{3}}}$$ Divide the numerator and denominator by the GCF, $2 \cdot 3$.

$$= \frac{3}{2 \cdot 2} \text{ or } \frac{3}{4}$$ Simplify.

Algebraic fractions can also be written in simplest form. Again, you can write the prime factorization of the numerator and the denominator, then divide by the GCF.

Example 2 Simplify $\dfrac{24ab^2}{36a^2}$.

$$\frac{24ab^2}{36a^2} = \frac{\overset{1}{\cancel{2}} \cdot \overset{1}{\cancel{2}} \cdot 2 \cdot \overset{1}{\cancel{3}} \cdot \overset{1}{\cancel{a}} \cdot b \cdot b}{\underset{1}{\cancel{2}} \cdot \underset{1}{\cancel{2}} \cdot \underset{1}{\cancel{3}} \cdot 3 \cdot \underset{1}{\cancel{a}} \cdot a}$$ Divide the numerator and denominator by the GCF, $2 \cdot 2 \cdot 3 \cdot a$.

$$= \frac{2 \cdot b \cdot b}{3 \cdot a} \text{ or } \frac{2b^2}{3a}$$ Simplify.

29. SOUND Decibels are units used to measure sound. The softest sound that can be heard is rated as 0 decibels (or a relative loudness of 1). Ordinary conversation is rated at about 60 decibels (or a relative loudness of 10^6). A rock concert is rated at about 120 decibels (or a relative loudness of 10^{12}). How many times greater is the relative loudness of a rock concert than the relative loudness of ordinary conversation?

Dividing Powers with Different Bases

Some powers with different bases can be divided. First, you must be able to write both as powers of the same base. An example is shown below.

$$\frac{2^5}{8^2} = \frac{2^5}{(2^3)^2} \qquad \text{To find the power of a power, multiply the exponents.}$$

$$= \frac{2^5}{2^6}$$

$$= 2^{-1} \text{ or } \frac{1}{2}$$

This method could not have been used to divide $\frac{2^5}{9^2}$, since 9 cannot be written as a power of 2 using integers.

Simplify each fraction using the method shown above. Express the solution without exponents.

1. $\frac{8^2}{2^2}$

2. $\frac{16^4}{8^3}$

3. $\frac{9^3}{3^3}$

4. $\frac{81^4}{3^4}$

5. $\frac{3^9}{81^2}$

6. $\frac{32^4}{16^4}$

7. $\frac{125^2}{25^3}$

8. $\frac{6^6}{216^2}$

9. $\frac{10^6}{1000^3}$

10. $\frac{64^3}{8^5}$

11. $\frac{27^5}{9^4}$

12. $\frac{343^3}{7^5}$

Scientific Notation

When you deal with very large numbers like 5,000,000 or very small numbers like 0.0005, it is difficult to keep track of place value. Numbers such as these can be written in **scientific notation**. A number is expressed in scientific notation when it is written as a product of a factor and a power of 10. The factor must be greater than or equal to 1 and less than 10.

By definition, a number in scientific notation is written as $a \cdot 10^n$, where $1 \le a < 10$ and n is an integer.

Example 1 Express each number in standard form.

a. 6.32×10^5

$6.32 \times 10^5 = 632{,}000$ Move the decimal point 5 places to the right.

b. 7.8×10^{-6}

$7.8 \times 10^{-6} = 0.0000078$ Move the decimal point 6 places to the left.

Example 2 Express each number in scientific notation.

a. 62,000,00

To write in scientific notation, place the decimal point after the first nonzero digit, then find the power of 10.

$62{,}000{,}000 = 6.2 \times 10^7$ The decimal point moves 7 places. The power of 10 is 7.

b. 0.00025

$0.00025 = 2.5 \times 10^{-4}$ Place the decimal point after the first nonzero digit. The power of 10 is −4.

4-8 Enrichment

Scientific Notation

It is sometimes necessary to multiply and divide very large or very small numbers using scientific notation.

To multiply numbers in scientific notation, use the following rule.

> For any numbers a and b, and any numbers c and d,
> $(c \times 10^a)(d \times 10^b) = (c \times d) \times 10^{a + b}$.

Example 1

$$(3.0 \times 10^4)(-5.0 \times 10^{-2}) = [3.0 \times (-5.0)] \times 10^{4 + (-2)}$$
$$= -15.0 \times 10^2$$
$$= -1.5 \times 10^3 \text{ or } -1500$$

To divide numbers in scientific notation, use the following rule.

> For any numbers a and b, and any numbers c and d, $(d \neq 0)$
> $(c \times 10^a) \div (d \times 10^b) = (c \div d) \times 10^{a - b}$.

Example 2

$$(24 \times 10^{-4}) \div (1.5 \times 10^2) = (24 \div 1.5) \times 10^{-4 - 2}$$
$$= 16 \times 10^{-6}$$
$$= 1.6 \times 10^{-5} \text{ or } 0.000016$$

Multiply or divide. Express each product or quotient in scientific notation.

1. $(2.7 \times 10^9) \times (3.1 \times 10^2)$

2. $(6.1 \times 10^{-2}) \times (1.3 \times 10^5)$

3. $(5.4 \times 10^{-3}) \div (1.8 \times 10^2)$

4. $(6.9 \times 10^{-3}) \div (3.0 \times 10^{-8})$
